CS 61C Midterm #2 — November 13, 2003

Your name _____

login cs61c–_____

Discussion section number _____

TA's name _____

This exam is worth 30 points, or 15% of your total course grade. The exam contains thirteen substantive questions, plus the following:

Question 0 (1 point): Fill out this front page correctly, including the signature, and put your name and login correctly at the top of each of the following pages.

This booklet contains six numbered pages including the cover page. Put all answers on these pages, please; don't hand in stray pieces of paper. This is an open book, open notes exam; no electronic devices allowed.

READ AND SIGN THIS:

I certify that my answers to this exam are all my own work, and that I have not discussed the exam questions or answers with anyone prior to taking this exam.

If I am taking this exam early, I certify that I shall not discuss the exam questions or answers with anyone until after the scheduled exam time.

_____

0	/1
1–3	/5
4–6	/6
7	/6
8–10	/6
11–13	/6
total	/30

Question 1 (1 point):

Which part of the translation process is responsible for register `$1` (`$at`)? (Choose one answer.)

_____Loader

_____Linker

_____Assembler

_____Compiler

Question 2 (2 points):

Which of the following is *not* a job of the linker? (Choose one answer.)

_____relocation

_____compute branch offsets

_____combine .o files

_____resolve external symbols

Question 3 (2 points):

You have a choice between two disks which are identical except for seek time and transfer rate:

A. 5 ms avg. seek time, 50 MB/s transfer rate

B. 10 ms avg. seek time, 100 MB/s transfer rate

Which would you choose based upon the following access patterns? (Choose either A or B for each pattern.)

Small 1K files: _____

Large (1MB) files stored in contiguous blocks on disk: _____

Your name _____ login cs61c–_____

Question 4 (2 points):

For each of the following protocols, indicate its level in the protocol stack by writing one of the words Link, Network, Transport, or Application:

TCP _____

HTTP _____

IP _____

Ethernet _____

UDP _____

Question 5 (2 points):

Imagine that two networked computers, A and B, have a one-way network latency of 2ms and a network bandwidth of 1 Mbit/sec (10^6 bits/sec). How long, in milliseconds, does it take between the time A starts sending a 125 byte (total, including headers, etc.) data packet to B, and the time A receives the entire acknowledgement (ACK) packet? Assume ACKs are the same size as the data packet, and it takes a computer 1ms to generate an ACK in response to receiving an entire incoming packet.

Question 6 (2 points):

Why can't interrupt handlers use the stack pointer they find in `$sp`? Choose the best answer.

_____The interrupt handler is in kernel memory while the stack resides in user memory.

_____An interrupt might occur while the stack pointer is being updated.

_____The interrupt handler might overflow the application's stack space.

_____Interrupt handlers have no need for a stack.

Question 7 (6 points):

While working on project 4 (the interrupt project), your friend asks you to to help debug the receiver interrupt portion of his/her code. Explain what is wrong, **either by changing the code or by writing a single English sentence and showing where the problem is in the existing code,** for each bug. The bugs do not involve enabling and disabling of interrupts, saving and restoring the EPC, or any part of the kdata section. **There are three bugs.**

Question 8 (2 points):

A cache access takes 30ns and a memory access takes 200ns. The cache is accessed first; if the desired address is not found in the cache, then main memory is accessed. What's the minimal cache hit rate necessary for the cache to improve average performance?

Question 9 (2 points):

Caculate the sizes (number of bits) of the fields for the given caches.

(a) The cache's total data capacity is 64 Kbytes, the block size is 32 words, and the cache is direct mapped.

tag _____

index _____

offset _____

(b) The same cache as in (a), but 4-way set associative.

tag _____

index _____

offset _____

Question 10 (2 points):

(a) As you go from direct mapped to fully associative, your hit *rate* will usually (pick one):

_____decrease _____increase _____not change

(b) As you go from direct mapped to fully associative, your hit *cost* (time required) will (pick one):

_____decrease _____increase _____not change

Question 11 (2 points):

A machine has 32 bit virtual and physical addresses. The page size is 16K bytes. Here is the TLB:

	Virtual Page Number	Physical Page Number
0	0x0789	0x0030
1	0x0084	0x050a
2	0x0021	0x1000
3	0x0800	0x5683

What physical address corresponds to the virtual address `0x002124f8`?

Question 12 (2 points):

Here are four concepts relating to virtual memory:

A. working set
B. TLB
C. multitasking
D. LRU replacement

It can be sensible for a computer's virtual address space to be bigger than its maximum possible physical memory size because of (choose one of A–D) _____.

It can be sensible for a computer's virtual address space to be smaller than its maximum possible physical memory size because of (choose one of A–D) _____.

Question 13 (2 points):

Here are eight concepts relating to virtual memory:

A. working set
B. write-through
C. write-back
D. LRU replacement
E. random replacement
F. shared code
G. heap allocation
H. set associativity

For each of the four page table entry flag bits, indicate which concept is most relevant (choose one of A–H):

Valid _____ Referenced _____

Writeable _____ Dirty _____
